

# Chemical Clean, Degrease, Boilout

A controlled application of chemically treated water to plant piping and equipment through a circular flow path that allows gradual heating of the fluid and continuous contact of chemicals with system internal metal surfaces. The goal is to dissolve the tightly bonded products, mill scales, grease and oil and other deposits and transport them out of the system. The system will be left with bare base metal and chemically passivated system.

Apply to the Following Systems:

- Steam production boilers
- Heavily corroded pipe
- Process systems with high amounts of contamination
- Decommissioning of fuel oil and gas system
- Routine maintenance
